

HOW CAN I MESSAGE SAFELY?

01

Keep your messaging applications and devices up to date

Latest versions will include security patches.

02

Use Multi-factor Authentication (MFA)

MFA increases the security of your messaging app by adding another layer of protection.

03

Strip metadata from media before sharing

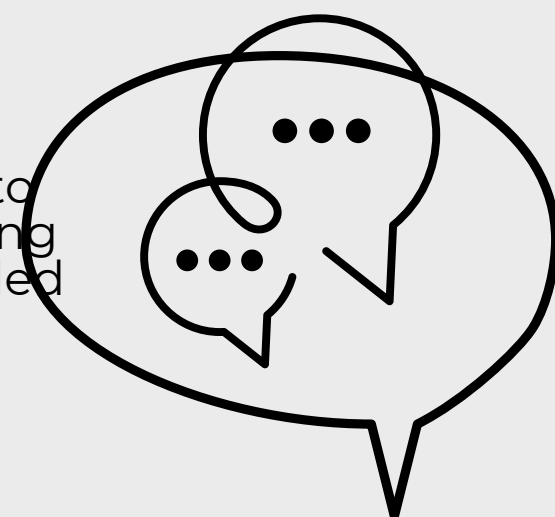

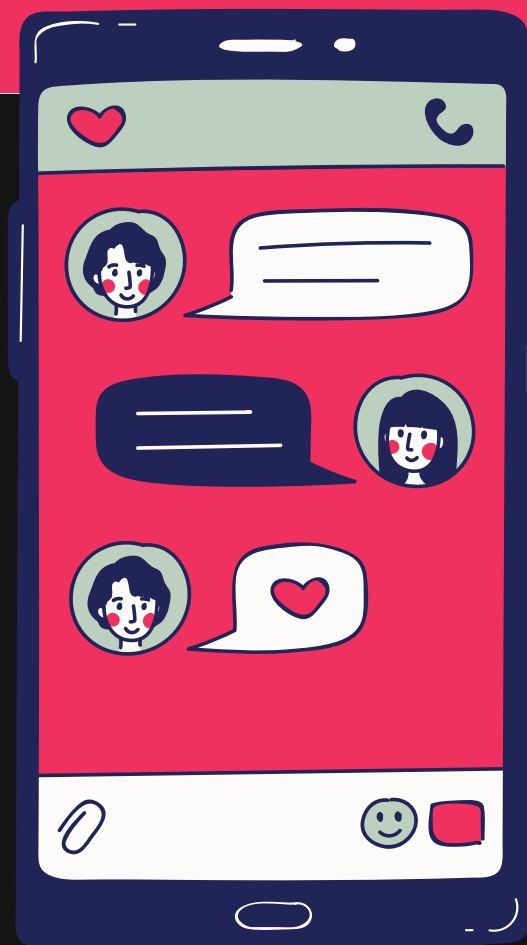

Failing to do this can lead to you unintentionally revealing more data than you intended including your location.

04

Verify your recipient is who they claim to be

You can do this either physically or cryptographically by using an app that offers contact verification.

Be careful with your sensitive information

Do not share information such as banking credentials and social security numbers.

05

Ensure your messaging app is legitimate

Use a secure messaging app that is fully open source and end-to-end encrypted.

06
